

L^AT_EX for Elegant Humanities Handouts in Conferences and Classrooms

Corey J. Stephan

Abstract

L^AT_EX has been popular throughout the mathematical and physical sciences for decades. L^AT_EX's utility for scholars in humanities disciplines, however, tends to be overlooked. In this tutorial, I introduce the use of L^AT_EX for a common task in humanities scholarship, namely, typesetting texts with unusual line length and other organizational needs, such as poetry and translations. The specific example is preparing a handout for a historical conference or class presentation with excerpts of ancient Greek and parallel English translations. Ultimately, I aim to inspire colleagues in religious, historical, philosophical, and related areas to think of L^AT_EX as having a wide range of professional applications even inside these scholarly fields in which L^AT_EX is not widespread.

1 Introduction

The world's best established software system for typesetting and document formatting, L^AT_EX has been popular throughout mathematical and physical sciences for decades. The utility of L^AT_EX for humanities disciplines, however, tends to be overlooked. L^AT_EX can be used for typesetting in most instances in which a scholar of humanities needs to present materials. Whether one works in history, philosophy, literature, or some other discipline in which L^AT_EX is not usually employed, L^AT_EX is nevertheless worth the investment of time to learn.

Granted, in disciplines outside the mathematical and physical sciences, such as my own area of historical theology (technically, divinities rather than humanities), editors expect us to prepare our materials for publications with bug-for-bug compatibility with Microsoft Word for back-and-forth markup. In practice, this expectation requires us to use word processors, such as LibreOffice Writer. A word processor presents material in a What You See Is What You Get (WYSIWYG, “whizzy-wig”) style. While one writes, one is simultaneously thinking about and working on formatting.

In a typesetting language, such as L^AT_EX (or ConT_EXt or Typst, either of which a scholar might also choose for various reasons), one is only concerned about the structure of what one is writing. One declares that specific characters will be in certain categories of writing ‘things’ (heading, paragraph, footnote, accent type, typeface, and so on), and one allows the program to compile one's writing as ‘code’

into a tidy final document — every time. Preparing a *curriculum vitae*, conference handout, or other document with unusual typesetting requirements becomes about the writing itself rather than the formatting.

To learn L^AT_EX as a scholar outside the disciplines in which L^AT_EX is the norm, I recommend working through one of two community-built, libre guidebooks. The first, which I used to learn L^AT_EX, is *The Not So Short Introduction to L^AT_EX* (github.com/oetiker/lshort). The second, which a close colleague of mine recommends, is *Modern L^AT_EX* (github.com/mrkline/modern-latex). Either guidebook may be used to begin to learn how to typeset cover letters, ancient languages, and other materials that are relevant across the humanities — without the front-loading of mathematics and physical sciences that one finds in other general introductions.

To show how thinking about digital typesetting in terms of document structure rather than final format can be of practical use in the humanities, here I present a tutorial in which I introduce the use of L^AT_EX for a common task in humanities scholarship, namely, typesetting texts with unusual line length and other organizational needs. The thought experiment is that of determining how to prepare a handout for a historical conference or class presentation with perfectly organized excerpts of a Byzantine Greek text and an original English translation in parallel.

2 Simplest parallel text in L^AT_EX

There are many ways to set parallel text in L^AT_EX. The simplest is to use the community package called `parallel`, which is included in T_EX Live, MiK_T_EX, and other L^AT_EX distributions. For full documentation, visit <https://ctan.org/pkg/parallel>.

To start using `parallel` in any L^AT_EX document, include the following in the preamble:

```
\usepackage{parallel}

For example, here is an abbreviation of the preamble to the Beamer file for my talk at TEX Users Group 2026 (github.com/historical-theology/latex-talks/) with only the most important entries, including parallel:

\documentclass[aspectratio=169]{beamer}
\usetheme{Goettingen}

\usepackage{parallel}

\title{\LaTeX\ for Elegant Humanities Handouts
  \ in Conferences and Classrooms }
\author{Corey Stephan, Ph.D.}

\begin{document}
```

The basic format for parallel text set with `parallel` looks like this:

```
\begin{Parallel}{<left space>}{<right space>}
\ParallelLText{<left text row 1>}
\ParallelRText{<right text row 1>}
\ParallelPar
\ParallelLText{<left text row 2>}
[and so on]
\end{Parallel}
```

I (a theologian) might typeset the opening words of the Christian prayer *Ave Maria* in their traditional Latin with parallel English like so:

```
\begin{Parallel}{0mm}{0mm}
\ParallelLText{Ave Maria,}
\ParallelRText{Hail Mary,}
\ParallelPar
\ParallelLText{gratia plena,}
\ParallelRText{full of grace,}
\ParallelPar
\end{Parallel}
```

Ave
Maria
gra-
tia
plena

Hail
Mary
full
f
race
